

Let $A, B \in M_3(\mathbb{C}); C, D \in M_5(\mathbb{C}); E, F \in M_7(\mathbb{C})$. Show that:

$$|\text{rank}(AB) - \text{rank}(BA)| + |\text{rank}(CD) - \text{rank}(DC)| + |\text{rank}(EF) - \text{rank}(FE)| \leq 6$$

Daniel Sitaru

Solution 1 by proposer.

Lemma: If $U, V \in M_n(\mathbb{C}); n \in \mathbb{N}; n \geq 2$ then:

$$(1) \quad |\text{rank}(UV) - \text{rank}(VU)| \leq \left[\frac{n}{2} \right]$$

$[*]$ - great integer function.

Proof.

Without lost of generalization suppose that:

$$\text{rank}(UV) \geq \text{rank}(VU)$$

$$\text{rank}(UV) - \text{rank}(VU) \leq \text{rank}(UV) \leq \text{rank}(U)$$

$$(2) \quad \text{rank}(UV) - \text{rank}(VU) \leq \text{rank}(U)$$

By Sylvester's inequality:

$$\text{rank}(VU) \geq \text{rank}(U) + \text{rank}(V) - n$$

$$-\text{rank}(VU) \leq n - \text{rank}(U) - \text{rank}(V)$$

$$\text{rank}(UV) - \text{rank}(VU) \leq \text{rank}(UV) + n - \text{rank}(U) -$$

$$-\text{rank}(V) \leq \text{rank}(V) + n - \text{rank}(U) - \text{rank}(V) = n - \text{rank}(U)$$

$$(3) \quad \text{rank}(UV) - \text{rank}(VU) \leq n - \text{rank}(U)$$

By adding (2); (3):

$$2(\text{rank}(UV) - \text{rank}(VU)) \leq n$$

$$\text{rank}(UV) - \text{rank}(VU) \leq \frac{n}{2}$$

$$\text{But } \text{rank}(UV) - \text{rank}(VU) \in \mathbb{N} \Rightarrow$$

$$\Rightarrow \text{rank}(UV) - \text{rank}(VU) \leq \left[\frac{n}{2} \right]$$

□

Back to the problem. By (1):

$$(4) \quad |\text{rank}(AB) - \text{rank}(BA)| \leq \left\lfloor \frac{3}{2} \right\rfloor = 1$$

$$(5) \quad |\text{rank}(CD) - \text{rank}(DC)| \leq \left\lfloor \frac{5}{2} \right\rfloor = 2$$

$$(6) \quad |\text{rank}(EF) - \text{rank}(FE)| \leq \left\lfloor \frac{7}{2} \right\rfloor = 3$$

By adding (4); (5); (6):

$$\begin{aligned} & |\text{rank}(AB) - \text{rank}(BA)| + |\text{rank}(CD) - \text{rank}(DC)| + \\ & + |\text{rank}(EF) - \text{rank}(FE)| \leq 1 + 2 + 3 = 6 \end{aligned}$$

□

Solution 2 by Oliver Geupel.

Let n be a positive integer and $M, N \in M_n(\mathbb{C})$. We will show that

$$(1) \quad |\text{rank}(MN) - \text{rank}(NM)| \leq \frac{n}{2}$$

Since the left hand side is an integer the result then follows immediately. We know that $\text{rank}(MN)$ and $\text{rank}(NM)$ are at most $\min(\text{rank}(M), \text{rank}(N))$. If $\min(\text{rank}(M), \text{rank}(N)) \leq \frac{n}{2}$, then (1) follows immediately. So suppose that $\text{rank}(M)$ and $\text{rank}(N)$ are both greater than $\frac{n}{2}$. Applying Sylvester's inequality, we obtain

$$\min(\text{rank}(MN), \text{rank}(NM)) \geq \text{rank}(M) + \text{rank}(N) - n.$$

Therefore

$$\begin{aligned} -\frac{n}{2} &< \text{rank}(M) - n = (\text{rank}(M) + \text{rank}(N) - n) - \text{rank}(N) \\ &\leq \text{rank}(MN) - \text{rank}(NM) \\ &\leq \text{rank}(M) - (\text{rank}(M) + \text{rank}(N) - n) \\ &= n - \text{rank}(N) < \frac{n}{2} \end{aligned}$$

It follows that $|\text{rank}(MN) - \text{rank}(NM)| \leq \frac{n}{2}$ and we are done. □
